# Things we'll cover

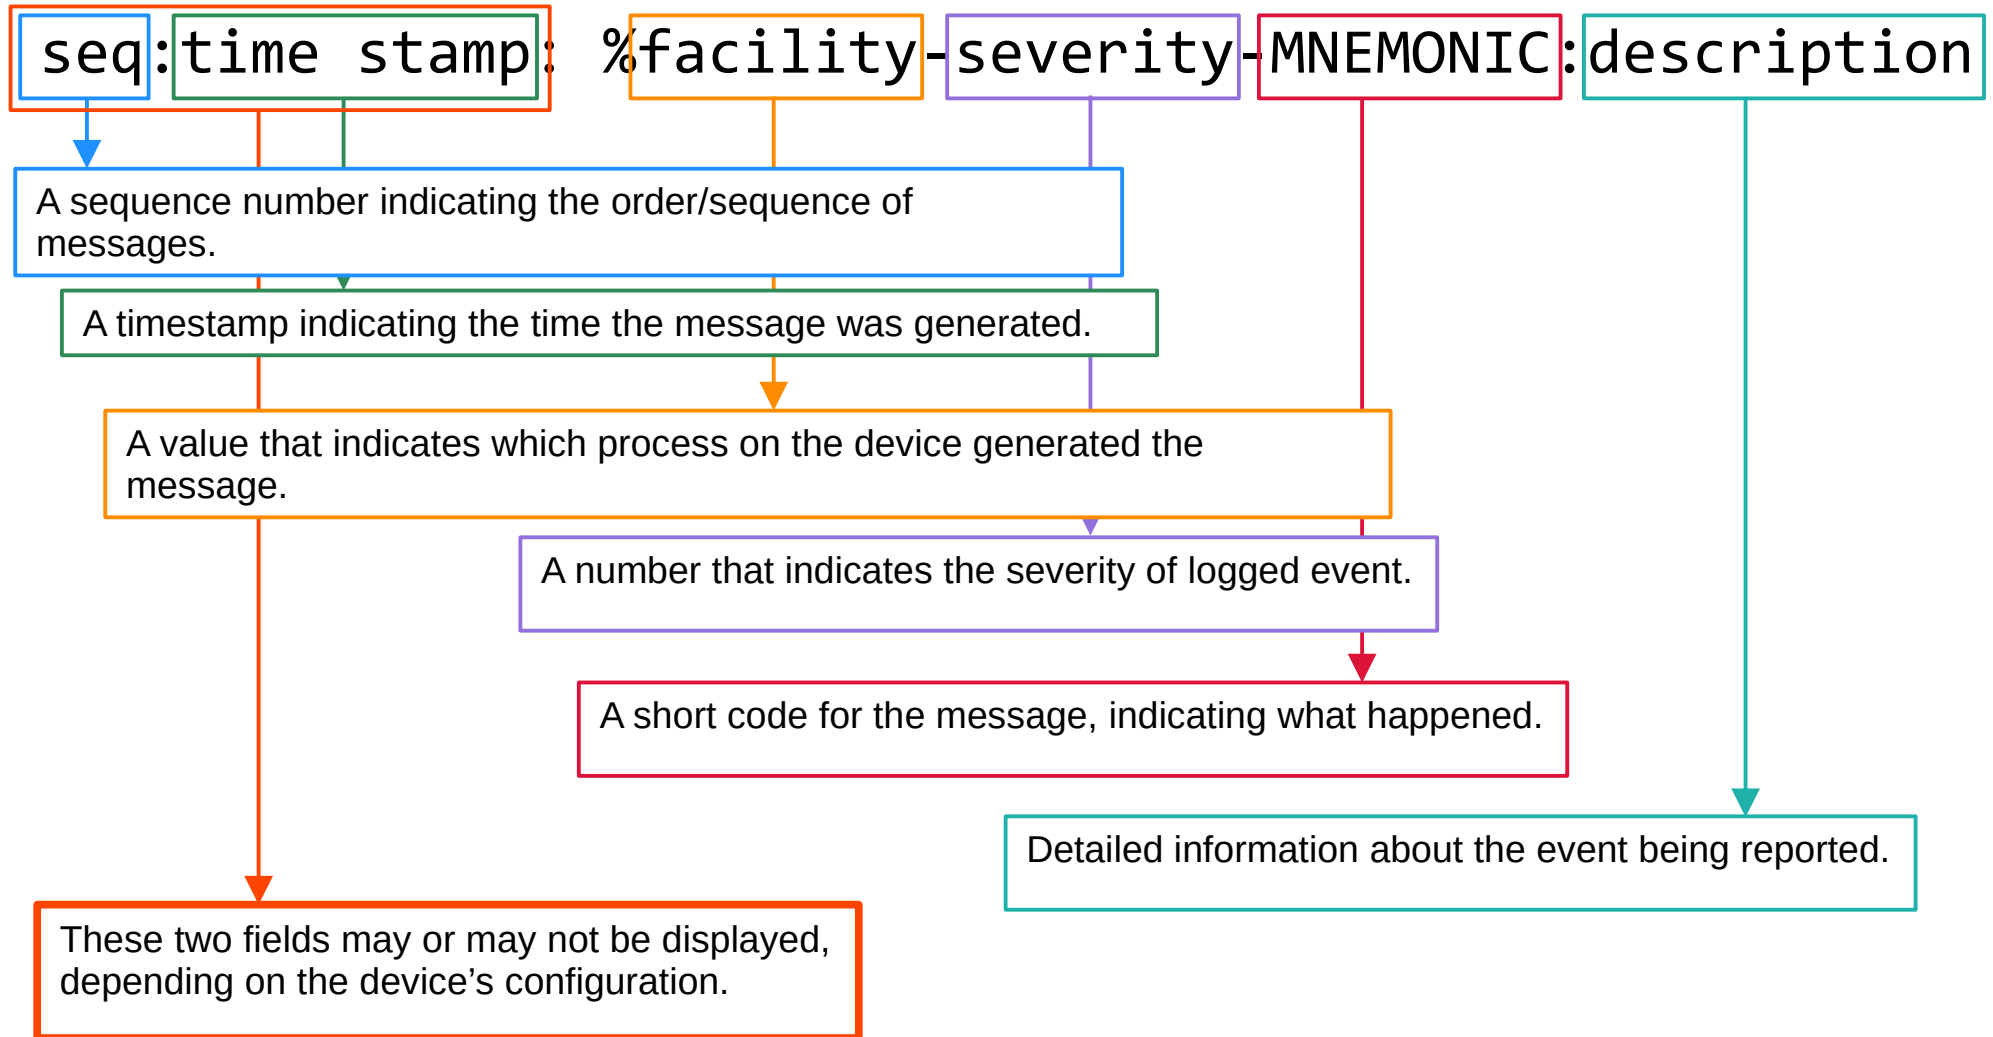

- Syslog overview
- Syslog message format
- Syslog facilities and severity levels
- Syslog configuration

- Syslog is an industry standard protocol for message logging.
- On network devices, Syslog can be used to log events such as changes in interface status (up⇔down), changes in OSPF neighbor status (up⇔down), system restarts, etc.
- The messages can be displayed in the CLI, saved in the device's RAM, or sent to an external Syslog server.

```
R1(config)#int g0/0
R1(config-if)#no shutdown
R1(config-if)#
*Feb 11 03:02:55.304: %LINK-3-UPDOWN: Interface GigabitEthernet0/0, changed state to up
*Feb 11 03:02:56.305: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/0, changed state to up
```

- Logs are essential when troubleshooting issues, examining the cause of incidents, etc.
- Syslog and SNMP are both used for monitoring and troubleshooting of devices. They are complementary, but their functionalities are different.

# Syslog Message Format

# Syslog Severity Levels

Level	Keyword	Description
0	Emergency	System is unusable
1	Alert	Action must be taken immediately
2	Critical	Critical conditions
3	Error	Error conditions
4	Warning	Warning conditions
5	Notice	Normal but significant condition ( <b>Notification</b> )
6	Informational	Informational messages
7	Debugging	Debug-level messages

**E**very **A**wesome **C**isco **E**ngineer **W**ill **N**eed **I**ce cream **D**aily

# Syslog Message Examples

seq:time stamp: %facility-severity-MNEMONIC:description

```
*Feb 11 03:02:55.304: %LINK-3-UPDOWN: Interface GigabitEthernet0/0, changed state to up
```

```
*Feb 11 05:04:39.606: %OSPF-5-ADJCHG: Process 1, Nbr 192.168.1.2 on GigabitEthernet0/0 from  
LOADING to FULL, Loading Done
```

```
000043: *Feb 11 05:06:43.331: %SYS-5-CONFIG_I: Configured from console by jeremy on console
```

```
*Feb 11 07:27:23.346: %SYS-6-CLOCKUPDATE: System clock has been updated from 07:27:23 UTC Thu Feb  
11 2021 to 16:27:23 JST Thu Feb 11 2021, configured from console by jeremy on console.
```

# Syslog Logging Locations

- **Console line:** Syslog messages will be displayed in the CLI when connected to the device via the console port. By default, all messages (level 0 – level 7) are displayed.
- **VTY lines:** Syslog messages will be displayed in the CLI when connected to the device via *Telnet/SSH* (coming in a later video). Disabled by default.
- **Buffer:** Syslog messages will be saved to RAM. By default, all messages (level 0 – level 7) are displayed.  
→ You can view the messages with **show logging**.
- **External server:** You can configure the device to send Syslog messages to an external server.  
\*Syslog servers will listen for messages on **UDP port 514**. Remember that port number!

# Syslog Configuration

!configure logging to the console line

```
R1(config)#logging console 6
```

**logging console** *Level*

\*you can use the level **number** (6) or **keyword** (informational)  
\*this will enable logging for the *informational* severity and higher

!configure logging to the vty lines

```
R1(config)#logging monitor informational
```

**logging monitor** *Level*

\*same points as above about the level

!configure logging to the buffer

```
R1(config)#logging buffered 8192 6
```

**logging buffered** [*size*] *Level*

\*same points as above about the level  
\*buffer size is in bytes

!configure logging to an external server

```
R1(config)#logging 192.168.1.100
```

```
R1(config)#logging host 192.168.1.100
```

**logging server-ip**

**logging host** *server-ip*

\*these commands are the same!

```
R1(config)#logging trap debugging
```

**logging trap** *Level*

\*same points as above about the level  
\*this sets the logging level for the external server

# terminal monitor

- Even if **logging monitor level** is enabled, by default Syslog messages will not be displayed when connected via Telnet or SSH.
- For the messages to be displayed, you must use the following command:  

```
R1#terminal monitor
```
- This command must be used **every time you connect to the device via Telnet or SSH.**

# logging synchronous

- By default, logging messages displayed in the CLI while you are in the middle of typing a command will result in something like this:

```
R1(config)#exit
R1#show ip in
*Feb 11 09:38:41.607: %SYS-5-CONFIG_I: Configured from console by jeremy on
consoleterface brief
```

- To prevent this, you should use the **logging synchronous** on the appropriate *line*. (I will talk more about 'line' configuration in the Telnet/SSH video!)

```
R1(config)#line console 0
R1(config-line)#logging synchronous
```

- This will cause a new line to be printed if your typing is interrupted by a message.

```
R1(config)#exit
R1#show ip int
*Feb 11 09:41:00.554: %SYS-5-CONFIG_I: Configured from console by jeremy on console
R1#show ip int
```

**show ip int** was reprinted on a new line. This makes it easier to continue typing the command.

# service timestamps / service sequence-numbers

```
R1(config)#service timestamps log ?
```

```
datetime    Timestamp with date and time
uptime      Timestamp with system uptime
<cr>
```

**datetime** = timestamps will display the date/time when the event occurred.  
**uptime** = timestamps will display how long the device had been running when the event occurred.

```
R1(config)#service timestamps log datetime
```

```
R1(config)#
```

```
R1(config)#service sequence-numbers
```

```
R1(config)#exit
```

```
R1#
```

```
000039: *Feb 11 10:32:46: %SYS-5-CONFIG_I: Configured from console by
jeremy on console
```

# Syslog Command Summary

```
R1(config)# logging console severity
```

```
R1(config)# logging monitor severity
```

```
R1(config)# logging buffered [size] severity
```

```
R1(config)# logging server-ip
```

```
R1(config)# logging host server-ip
```

```
R1(config)# logging trap severity
```

```
R1# terminal monitor
```

```
R1(config-line)# logging synchronous
```

```
R1(config)# service timestamps log [datetime | uptime]
```

```
R1(config)# service sequence-numbers
```

# Syslog vs SNMP

- Syslog and SNMP are both used for monitoring and troubleshooting of devices. They are complementary, but their functionalities are different.
- **Syslog** is used for message logging.
  - Events that occur within the system are categorized based on facility/severity and logged.
  - Used for system management, analysis, and troubleshooting.
  - Messages are sent from the devices to the server. The server **can't** actively pull information from the devices (like SNMP **Get**) or modify variables (like SNMP **Set**).
- **SNMP** is used to retrieve and organize information about the SNMP managed devices.
  - IP addresses, current interface status, temperature, CPU usage, etc.
  - SNMP servers can use **Get** to query the clients and **Set** to modify variables on the clients.

# Things we covered

- Syslog overview
- Syslog message format
- Syslog facilities and severity levels
- Syslog configuration

What is the severity level of the following Syslog message?

\*Feb 11 09:41:00.554: %SYS-5-CONFIG\_I: Configured from console by jeremy on console

- a) System
- b) Informational
- c) Notification
- d) Warning
- e) Alert
- f) Debugging
- g) Config

What is the severity level of the following Syslog message?

\*Feb 11 03:02:55.304: %LINK-3-UPDOWN: Interface GigabitEthernet0/0, changed state to up

- a) Emergency
- b) Error
- c) Notification
- d) Notice
- e) Critical
- f) Notice
- g) Warning

Which of the following locations are Syslog messages sent to by default, without any specific Syslog configuration? (select two)

- a) External Syslog server
- b) Console line
- c) Buffer
- d) VTY lines

You issue the **logging buffered 6** command on R1. Syslog messages of which severity levels will be saved to the logging buffer?

- a) All Syslog messages
- b) Severity 6 and 7
- c) Severity 0 to 6
- d) Severity 6 only

Which of the following Syslog message fields might not be displayed, depending on the device's configuration? (select two)

seq:time stamp: %facility-severity-MNEMONIC:description

a) seq

b) facility

c) severity

d) time stamp
